[Appendices to Economic Report ECredits.docx](#)

Hi Cindy,

Attached is the appendix with my changes and comments. Rebecca noted this issue as well, but with the tables you see towards the end of the first appendix that compared the USFS and NPS numbers, I had troubles reformatting them with track changes turned on. We want to ditch the left side of each table, and keep the right side that shows the NPS numbers.

Give me a call if you have any questions!

Egan

Hi Cindy,

Thanks for sending this, and for the updates! I spoke with Rebecca a few weeks ago and she gave me a brief update on what has been going on in terms

of the review.

Just to confirm- you only want me to review the appendices? Is there anything in the main report I need to look at right now?

Also thanks about the picture- for the record, that was actually taken at Beaver Dam Wash NCA. :D

Hi Egan,  
Hope you're doing well (really like your USGS profile picture with your dog!!)

We are still working on your economics report and have been reviewing it in detail, alongside some review aid from DOI. I was wondering if you would have some time to review the appendices section with track changes turned on? As you can see by Rebecca's email below, she has already gone ahead and reviewed the first appendix.

Best,  
Cindy

Cindy,

Attached is a draft of the Appendices with track changes. I only edited the first appendix. You might take a careful read through the others to be sure they are consistent with the messaging in the report.

(b) (5) - DPP

██████████ You should wordsmith this to make sure the message is reasonable. There are a few spots where it would probably help to get Egan's input, and it's probably a really good idea to ask him to read this appendix again to make sure all the details are correct. I'm sure he's happy to help but I'll leave that up to you.

Let me know if you have any questions about the edits.

To: Sally Butts <[sbutts@blm.gov](mailto:sbutts@blm.gov)>

Hi Sally,

<https://drive.google.com/open?id=0B8akMDfZmooQZU5NVTa1OGkydVk>

I'm really sorry this is taking much longer than expected. A revised draft is on Google Drive at the link above. It includes fairly thorough editing and reorganizing. I'm still not satisfied with the results section addressing values, but it probably makes the most sense to just leave it and proceed with the following:

1. Peer review. I suggest we send this to Ben Simon (chief economist DOI Office of Policy Analysis) and Lynne Koontz (economist NPS), asking if they or one of their colleagues will review specifically for:
  - ☐ Fatal flaws in the analytical approach to estimating contributions
  - ☐ Additional information needed to transparently describe the methodology
  - ☐ Any comments/concerns regarding the clarity and accuracy of how the basic concepts of contributions and values are presented and related to each other.

I would normally ask for a 2 week turnaround, but we could say quicker is

preferred. They'd probably understand. I work closely with both Ben and Lynne and I'm happy to contact them if you like.

2. Copy edit/layout. There are a number of formatting things to check. The layout is kind of confusing with all of the boxes. About half way through I realized that Egan probably spelled out National Conservation Lands every time on purpose, so my use of NCL should be corrected. I think I updated all the Table and Figure numbers, but this should be double checked. The page numbers in the TOC need updating. I couldn't change the date on the front cover, etc. Not sure what the plan is for publishing, so let me know if you'd like me to clean this stuff up.

Last thing – have the Appendices been updated since February? The version I have still refers to using both the NPS and the USFS expenditure profiles, which we don't do.

Again, sorry it took so long. Let me know if you want me to contact Ben and Lynne.

**Subject:** Fwd: economic report review and economic snapshots

Hi Rebecca,

Just checking in on the status of your review of the Economics report  
following our briefing with leadership  
earlier this month.

Also, Chris is interested to add in some additional content on visitor  
data which seems like a good idea.  
Egan prepared the attached  
spreadsheet which has snapshots of  
each unit's data including visitors. I  
think it would be great to eventually  
post the snapshots to our website  
along with the report and key  
statistics. I'm interested in your  
thoughts about how to incorporate a  
little bit more in the report itself on  
visitor data to show how much  
visitation is occurring at the  
monuments and NCAs.

Also, did you see Secretary Zinke's news release yesterday? This is  
great support for our Economics  
report. I copied the link to the release  
below.

<https://www.doi.gov/pressreleases/secretary-zinke-announces-349->

[billion-added-us-economy-2016-due-national-park](#)

Thanks so much for your help and let me know if you need anything.

Next step after your review is to go to the two peer reviewers you mentioned, one is with USFS as I recall.

## Appendices to Economic Report: National Conservation Lands

June 5, 2017

Egan Cornachione, GeoCorps Intern with National Conservation Lands

### Appendix A: Methodology for Estimating Visitor Spending Effects on National Conservation Lands

Economic contribution analysis of the National Conservation Lands visitors requires several different types of data. The four main types of information required are: number of visitors, visitor characteristics, spending patterns of visitors, and regional economic multipliers. Units report annual visitation estimates and activity participation in the BLM's Recreation Management Information System (RMIS). Regional economic multipliers were generated for this project using the IMPLAN software and data system (IMPLAN Group LLC). Although the Bureau of Land Management conducted two pilot projects of a visitor use monitoring program in 2006 and 2009, there are very little data available on visitor characteristics and spending patterns of visitors (White nd).

For this report, estimates of visitor spending are based on comparable data from the NPS Visitor Services Project (VSP) associated with NPS sites located with or near National Conservation Lands units. While National Forests were also considered as potential sites to match with National Conservation Lands, the generic and park specific profiles for National Parks visitors developed by Thomas and Koontz (2016) are considered to better represent visitors to the National Conservation Lands. National Monuments and NCAs are among the most popular BLM recreation sites: 21 sites reported over 100,000 visits in 2016.

A selection process was used to determine the most closely compatible National Park Service unit on which to base visitor characteristic and spending data for a BLM unit.

1. **Data:** The number of visitors to each unit  
**Source:** BLM's Recreation Management Information System (RMIS)  
**Assumption:** *Visitor data accurately reflects actual number of visitors to each unit.* There are many different forms of tracking visitor use of a monument or NCA. Some units, such as Jupiter Inlet Lighthouse ONA, have a visitor center through which visitors pay a fee to enter the unit, which lends itself to a relatively straightforward counting process. Others have many access points and no fee stations. In these cases, a variety of methods are used to count visitation including traffic counters, fee slips, and the judgement of managers. The 2006 pilot implementation of the USFS NVUM program on three BLM sites found that in two of three cases, RMIS visitation estimates were significantly *higher* than what was found in the survey, while in the third case, RMIS produced a significant *underestimation* of visitation when compared with the NVUM survey. Because of this limitation, results are reported both in terms of total economic contributions as well as per visit

Formatted: Font: Italic

Formatted: Font: Italic

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

economic contributions. Assuming visitor characteristics remain relatively constant, per visit contributions provide the most accurate way of estimating total contributions.

2. **Data:** Visitor characteristics. This includes the distribution of types of visitors to each unit, into categories of *local* and *non local*, *day* and *overnight*, *camping in the unit* or *staying outside the unit*. Within each of these categories, data on the party size, number of days spent at the unit, and re entry rates were also used.

**Source:** National Park Service Visitor Services Project (VSP) surveys (2003 2015)

**Assumption:** *The characteristics of BLM National Monument and NCA visitors are comparable to those of NPS visitors.* The spending patterns of different types of visitors are widely varied, so it is important to be able to break visitors into categories to account for these differences. White et al (2013) note that visitor trip type segments explain a large portion of the total variation in trip expenditures. This means that the accuracy of visitor trip type estimates is linked directly to the accuracy of economic contribution estimates. The most crucial component is the percentage of local vs. non local visits. Although there is no way to be sure, National Park Service units *may* average higher non local visitation than BLM monuments and NCAs. This difference is not reflected in this analysis. Local day visitors tend to spend the least money overall, and mostly on gas and oil, while non local overnight visitors have the greatest total expenditures, especially on lodging and restaurants (White et al 2013).

Spatial relationships were used to select the most comparable NPS site to use for the analysis of each unit. To select these sites, a buffer analysis was run in ArcMap 10.2 using spatial data from the National Conservation Lands and the National Park Service to select NPS sites within 25, 50, and 125 miles of the National Conservation Lands site. In cases where multiple NPS sites were matched, factors of access, recreation types and unit resources were considered when selecting the most comparable site. Since not all NPS sites have been surveyed for visitor characteristics, several generic profiles have been developed to apply to non surveyed sites. In these cases, the generic profile for the NPS site that was matched with BLM site was applied.

3. **Data:** The spending patterns of visitors on their trips, broken down into *hotel*, *camping*, *restaurants*, *groceries*, *gas and oil*, *fees*, *entertainment*, *sporting goods*, and *souvenirs*.

**Source:** National Park Service Visitor Services Project (VSP) surveys (2003 2015)

**Assumption:** *The spending patterns of BLM visitors are similar to those of NPS visitors.*

Spending is estimated from visitor surveys for each trip type in a number of different economic sectors, within 50 miles of the unit. Spending generally includes only specific trip related expenditures such as groceries, gas, restaurants and hotels. Purchases of durable goods and other major one time expenditures typically are not included in these estimations. In other words, if a survey respondent had reported \$1000 in sporting goods expenditures on their trip, this observation was not included in the calculation of trip related expenditures since the purchase is likely related to a generic interest unrelated to that particular visit.

Spending estimates in each trip type segment do not vary considerably between the NPS VSP profiles and the USFS NVUM data that were also considered. The major differences in total spending at units arise from the distribution of trip type segments. The majority (65%) of USFS visits

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

fall into low spending categories such as local and non primary, while the majority (69%) of NPS visits in the highest spending generic profile fall into the non local day and overnight lodging categories. These visitor trip type differences result in greater total expenditures and greater overall economic contributions when using NPS comparisons than USFS comparisons. There is no data on BLM's National Monument and NCA visitor trip characteristics, so the distribution of local vs. nonlocal and day vs. overnight visitors is assumed to be similar to NPS sites. (b) (5) - DPP

4.

**Data:** Regional economic multipliers  
**Source:** IMPLAN Group LLC. (Economic data compiled from US Census, Bureau of Economic Analysis, and Bureau of Labor Statistics)  
**Assumption:** *The state level economic multipliers from IMPLAN will effectively capture the linkages between BLM trip spending sectors and other regional economic sectors.* IMPLAN models the flow of goods and services between all sectors in an economy. In this analysis, the state that contains the monument or NCA is the economy that is modeled for each unit. As a result, states that have a greater number of economic sectors will generally experience a greater flow of spending within the state before dollars "leak" out of the economy. Local economic contributions would generally be smaller compared to state level contributions, while at a national level they would be greater due to the greater number of economic linkages in a larger region. Using the state level model, however, masks a certain amount of variation in local multipliers. For example, if a local economy is largely service based, the multiplier for spending in service sectors could be higher in the local region than for the total state economy. Since spending is divided among eight sectors, it is presumed that any effects related to these discrepancies may be relatively small.

These four components of visitor information are variables that, taken together, are used to give an estimate of visitor spending impact. Following is a step by step example of how visitor spending was estimated at Gunnison Gorge National Conservation Area. This process was replicated for all 46 Monuments and NCAs.

Estimating Visitor Spending Effects (Gunnison Gorge National Conservation Area):

**Step 1. Number of Visits.** An estimated 206,036 visits to the unit took place in 2015 (BLM RMIS)

**Step 2. Visit Segments.** The NPS divides overnight visits into camping on and off site and offsite lodging.

Commented [MRL1]: t. (b) (5) - DPP

**Step 3. Visit Distributions.** Multiplying the 206,036 visitors by the types of visit gives the following distribution of visitors to Gunnison Gorge NCA:

**Step 4. Party Size, Length of Stay and Re Entry Rate.** NPS profiles are generated per party per day/night. This requires party visits to be multiplied by length of stay divided by re entry rate (to avoid double counting of visits).

**Step 5. Party Days/Nights.** Visits for each segment from step 3 are converted into party day/nights

| USFS Comparison                        | NPS Comparison           |
|----------------------------------------|--------------------------|
| Party Visits:                          | Party Day/Nights:        |
| a) Local Day: 47,478                   | a) Local Day: 4,579      |
| b) Local Overnight onsite: 3,253       | b) Non Local Day: 24,795 |
| c) Local Overnight offsite: 1,717      | c) Camp Onsite: 5,821    |
| d) Non Local Day: 6,010                | d) Lodge Offsite: 35,636 |
| e) Non Local Overnight onsite: 5,547   | e) Camp Offsite: 6,440   |
| f) Non Local Overnight offsite: 14,594 | f) Non Primary: 20,319   |
| g) Non Primary: 7,359                  |                          |

**Step 6. Spending Profiles.**

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

Spending profiles based on National Park Service VSP data are arranged by trip type: local and non local day, onsite and offsite camping, offsite lodging, and non primary. The NPS profiles show spending per party per day/night. In other words, if a party spends three nights at the unit, then the per party per day/night spending amount is applied three times. This is why party visits are converted to party day/nights in Step 5.

| NPS Spending Profile for "Camp Only" Site Visits (In \$2015 per day/night) |           |         |         |           |          |         |
|----------------------------------------------------------------------------|-----------|---------|---------|-----------|----------|---------|
|                                                                            | Local Day | NL Day  | Camp In | Lodge Out | Camp Out | Other   |
| <i>Motel</i>                                                               | \$0.00    | \$0.00  | \$0.00  | \$109.76  | \$0.00   | \$0.00  |
| <i>Camping</i>                                                             | \$0.00    | \$0.00  | \$10.74 | \$1.13    | \$28.93  | \$0.00  |
| <i>Restaurants</i>                                                         | \$6.30    | \$12.34 | \$7.57  | \$46.73   | \$13.47  | \$6.24  |
| <i>Groceries</i>                                                           | \$5.84    | \$5.60  | \$10.59 | \$11.16   | \$12.73  | \$5.64  |
| <i>Gas and Oil</i>                                                         | \$9.89    | \$16.54 | \$15.40 | \$24.86   | \$32.19  | \$8.80  |
| <i>Transportation</i>                                                      | \$0.97    | \$3.34  | \$3.82  | \$13.72   | \$4.30   | \$2.74  |
| <i>Admission and Fees</i>                                                  | \$5.15    | \$9.47  | \$4.90  | \$13.30   | \$10.26  | \$3.41  |
| <i>Souvenirs and Other</i>                                                 | \$5.04    | \$11.99 | \$9.57  | \$17.29   | \$13.23  | \$5.86  |
| <i>Total</i>                                                               | \$33.19   | \$59.28 | \$62.59 | \$237.95  | \$115.11 | \$32.69 |

Step 7. *Total Spending Calculation.* Finally, the party visits from step 5 are multiplied by each spending item from step 6 to give total spending.

Using the NPS VSP Profile:

| Visitor Spending by Visit Type and Sector, Gunnison Gorge NCA in 2016 (\$2015) |           |             |           |             |           |           |              |
|--------------------------------------------------------------------------------|-----------|-------------|-----------|-------------|-----------|-----------|--------------|
|                                                                                | Local Day | NL Day      | Camp In   | Lodge Out   | Camp Out  | Other     | Total        |
| <i>Motel</i>                                                                   | \$0       | \$0         | \$0       | \$4,037,746 | \$0       | \$0       | \$4,037,746  |
| <i>Camping</i>                                                                 | \$0       | \$0         | \$64,537  | \$41,569    | \$192,327 | \$0       | \$298,433    |
| <i>Restaurants</i>                                                             | \$29,779  | \$315,853   | \$45,488  | \$1,719,059 | \$89,549  | \$130,886 | \$2,330,614  |
| <i>Groceries</i>                                                               | \$27,605  | \$143,337   | \$63,636  | \$410,543   | \$84,629  | \$118,301 | \$848,051    |
| <i>Gas and Oil</i>                                                             | \$46,749  | \$423,356   | \$92,539  | \$914,526   | \$214,000 | \$184,583 | \$1,875,752  |
| <i>Transportation</i>                                                          | \$4,585   | \$85,490    | \$22,954  | \$504,718   | \$28,586  | \$57,472  | \$703,807    |
| <i>Admission and Fees</i>                                                      | \$24,344  | \$242,393   | \$29,444  | \$489,268   | \$68,209  | \$71,526  | \$925,183    |
| <i>Souvenirs and Other</i>                                                     | \$23,824  | \$306,895   | \$57,506  | \$636,048   | \$87,953  | \$122,915 | \$1,235,141  |
| <i>Total</i>                                                                   | \$156,886 | \$1,517,324 | \$376,104 | \$8,753,477 | \$765,253 | \$685,683 | \$12,254,726 |

Formatted Table

Step 8. *Applying regional economic multipliers.*

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

Using IMPLAN software, economic multipliers for the state of Colorado were generated for each dollar spent in each of the above sectors. For example, for every \$1 million spent on hotels, the following economic effects occurred:

|                 | Employment | Labor Income | Value Added | Output      |
|-----------------|------------|--------------|-------------|-------------|
| Direct Effect   | 10.3       | \$353,464    | \$621,845   | \$1,000,000 |
| Indirect Effect | 2.6        | \$140,870    | \$227,588   | \$413,557   |
| Induced Effect  | 3          | \$138,150    | \$251,504   | \$427,326   |
| Total Effect    | 16         | \$632,484    | \$1,100,937 | \$1,840,882 |

The definitions for each of the effects analyzed is below:

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Employment</b>   | the annual average of monthly jobs, both part time and full time. One part or full time job lasting twelve months is equivalent to two part or full time jobs lasting six months. Note that these jobs are those supported by visitor spending, not necessarily jobs “created” by the unit. Some of the reported jobs would still exist without tourism generated from the National Conservation Lands unit. Additionally, since this analysis only tracks visitor spending on trip related goods and services, it does not directly calculate jobs associated with monument management. For the most part, BLM jobs are distinct from other jobs supported by visitation measured in an IMPLAN analysis. |
| <b>Labor Income</b> | all forms of employment income, including wages, benefits, and proprietor income. Labor income represents a portion the amount reported for value added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Value Added</b>  | the contribution of visitor spending to the Gross Domestic Product (GDP) of a regional economy. Value added is equal to the difference between the sale price of all goods sold and the production value of the goods. In other words, if a consumer spent \$100 at a motel and the operational and material expenses of the business to provide that room were \$40, then \$60 of value is added to the economy.                                                                                                                                                                                                                                                                                         |
| <b>Output</b>       | the total production value of goods and services supported by visitor spending. It is the sum of consumer purchases, exports, and intermediate sales between businesses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Since \$4,037,746 was spent on hotels by visitors to Gunnison Gorge NCA in 2016 (see table in step 7, last column of first row), the above economic multipliers are multiplied by 4.037746

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

(total spending divided by one million) to reach the following total effects from those motel expenditures:

|                 | Employment | Labor Income | Value Added | Output      |
|-----------------|------------|--------------|-------------|-------------|
| Direct Effect   | 44.0       | \$1,509,524  | \$2,655,688 | \$4,270,659 |
| Indirect Effect | 11.1       | \$601,608    | \$971,951   | \$1,766,161 |
| Induced Effect  | 12.8       | \$589,992    | \$1,074,088 | \$1,824,964 |
| Total Effect    | 68.3       | \$2,701,124  | \$4,701,727 | \$7,861,780 |

Following this same process for the visitor spending in each of the eight sectors gives the total economic effects from the visitor spending at Gunnison Gorge NCA:

|                 | Employment | Labor Income | Value Added  | Output       |
|-----------------|------------|--------------|--------------|--------------|
| Direct Effect   | 131.3      | \$3,851,010  | \$6,008,934  | \$9,725,092  |
| Indirect Effect | 24.4       | \$1,296,932  | \$2,251,518  | \$4,003,423  |
| Induced Effect  | 31.3       | \$1,440,729  | \$2,622,480  | \$4,455,961  |
| Total Effect    | 187.8      | \$6,588,671  | \$10,882,928 | \$18,184,475 |

**Result:** The \$12.3 million of visitor spending at Gunnison Gorge NCA supported 188 jobs, \$6.6 million in labor income, \$10.9 million in value added and \$18.2 million in economic output for the state of Colorado.

## Appendix B: Methodology for using Benefit Transfer for Nonmarket Recreation Values

### B.1: Valuing Recreation Experiences

Visitors to BLM sites often pay little or no fee, yet the experience they are consuming is, according to economic theory, worth the same or greater than the amount they paid. The resulting difference between one's "willingness to pay" and the amount they actually pay is called consumer

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

surplus. For example, if 100 visitors to a particular unit were each individually willing to pay \$25 for their experience, and each only had to pay a \$5 use fee, then a consumer surplus of \$20 per person (\$25 minus \$5), or \$2,000 total (100 visitors times \$20 surplus each), will be generated by the visits. If for some reason the site were closed down and those 100 visitors were not able to recreate, the unit would lose \$500 of annual fee revenue, and \$2,000 of economic value would be lost by consumers due to the closing of the unit.

In OMB Circular A 94, *Guidelines and Discount Rates for Benefit Cost Analysis of Federal Programs*, the memo states that “when it can be measured, consumer surplus provides the best measure of the total benefit to society from a government program or project” (OMB 1992, 6.b.1). Consumer surplus depends upon visitors’ willingness to pay for their recreation experience. Since little or no money is exchanged for BLM recreation experiences, consumers’ willingness to pay must be measured using a form of nonmarket valuation, the concept introduced in Section 2.3 of the main report. Two of the primary forms of nonmarket valuation techniques related to recreation are called contingent valuation and travel cost methods. The contingent valuation method utilizes surveys given to consumers which ask a series of questions to determine how much an individual would be willing to pay for the good or service in question. The travel cost method looks at how much money people spend making trips to recreation sites, how many trips they take, and what they give up to take those trips in order to derive a “demand curve” for recreation visitors. The curve represents consumers’ willingness to pay for their recreation experiences.

Generally, primary studies for estimating willingness to pay for recreation experiences can be time consuming and/or costly. Thus, one approach for estimating willingness to pay for different types of recreation experiences is by using a benefit transfer. The benefit transfer approach involves choosing previous studies conducted in similar areas to the site in question that have estimated willingness to pay and applying the benefits for similar experiences on the study site.

## B.2: The Benefit Transfer Approach to Valuing Recreation Experiences

The USGS, with support from Colorado State University’s Department of Agriculture and Resource Economics and Oregon State University’s College of Forestry, developed a toolkit for estimating recreation consumer surplus. The resource is called the “benefit transfer toolkit” and is publicly accessible at [my.usgs.gov/benefit-transfer/](http://my.usgs.gov/benefit-transfer/). It consists of a database of over 463 research studies that have utilized either the travel cost or contingent valuation model to estimate consumer surplus values for 13 forms of recreation activities in areas across the US. The database provides a total of 2900 individual recreation consumer surplus values, sortable by type of recreation, valuation method, location, and year. For each study listed, the database provides a per person, per day consumer surplus value for each type of recreation studied. For example, a study by Loomis et al (2005) used a travel cost model to estimate the benefits of general recreation in Steese National Conservation Area, Alaska. The study determined that the consumer surplus was \$61.75 per person per day for *all* types of recreation in this particular area. So, for example, if 10,000 people visit the site in a year, then the total consumer surplus for general recreation opportunities at Steese is \$617,500 (10,000 visits times \$61.75 per visit). This is not money that is exchanged, rather it represents the economic value of the recreational opportunities made available by the National Conservation Lands at Steese NCA.

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

Since original studies such as these are expensive and require the expertise of a trained economist, the use of a benefit transfer is one way to obtain economic values for sites that have not been studied (BLM IM 2013 131). This is where the recreation consumer surplus values from one site are transferred to a separate site with very similar characteristics to value a very similar recreational experience. So, if one wanted to estimate the economic value of general recreation at, say, White Mountains National Recreation Area (a nearby area in the eastern interior of Alaska), a benefit transfer might be used if the sites are deemed to have similar types of visitors. The \$61.75 per person per day figure would be multiplied by the number of visitors to White Mountains to obtain the total consumer surplus at that site, with the assumption that the value placed by visitors on the recreational opportunities at each are roughly similar.

In many cases a suitable comparison study is not available, so the next best approach is to use an average value transfer (BLM IM 2013 131). In an average value transfer, a number of similar sites are chosen to apply a value transfer. The average of the per person, per day surplus values is used to estimate the consumer surplus at the study site. The average value transfer method is used for consumer surplus calculations in the Grand Canyon Parashant National Monument case study. To create a generic tool for estimating economic value for recreation on National Conservation Lands, an average of all studies that valued each type of recreation in a particular state was used for a benefit transfer.

Both the benefit transfer and average value transfer methods may over or underestimate the true economic value associated with recreational opportunities at the transfer site. In general, the help of a trained economist should be enlisted when using these methods. Huber and Richardson (2016) provide further instruction and four case studies of how the benefit transfer method can be applied at BLM sites and offices.

### Appendix C: Tables to Aid in Identifying, Quantifying and Monetizing Economic Values Associated with National Monuments and NCAs

**Table C1: Resources, Objects and Values of National Monuments and NCAs**

*This table identifies the important resources, objects and values (ROVs) for which the BLM National Monuments and NCAs were designated to protect. The types of ROVs protected at each unit are identified in the legislation creating the designations.*

| Name               | Recreational Values | Educational Values | Cultural Values | Paleontological/ Geological Values | Scientific Values | Riparian/Water Values | Wildlife/Wildlife Habitat Values | Vegetation/ Ecological Values |
|--------------------|---------------------|--------------------|-----------------|------------------------------------|-------------------|-----------------------|----------------------------------|-------------------------------|
| Steese             |                     |                    | x               |                                    | x                 | x                     | x                                |                               |
| Gila Box Riparian  | x                   | x                  | x               | x                                  | x                 | x                     | x                                |                               |
| Las Cienegas       | x                   | x                  | x               | x                                  | x                 | x                     | x                                | x                             |
| San Pedro Riparian | x                   | x                  | x               | x                                  | x                 | x                     | x                                |                               |

**Table C2: A Resources, Objects, and Values Framework for Economic Analysis of National Monuments and NCAs Identifying Values**

*Each of the ROVs in table C1 has an associated economic value. The table below describes those economic values in terms of direct use, indirect use, and non use value. Direct use values are associated with the use of the resource. Indirect use values are those that do not require any direct interaction between humans and the resource. Non use values are those received without directly or indirectly using the resource.*

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

| ROV Category               | Direct Use Value                                                                                                                                                                                                                 | Indirect Use Value                                                                                                                                                                                                                                                                                       | Non-Use Value                                                                                                                                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recreational               | 1. Values ascribed to recreational experiences such as hiking, camping, or OHV use, as described in terms of individuals' willingness to pay for these activities<br>2. Fees collected from recreation visitors                  | 1. Health and other community benefits due to low cost recreation for community members                                                                                                                                                                                                                  | 1. Bequest value: conserving recreational opportunities for future generations to experience<br>2. Option value: conserving recreational opportunities for individuals who value the option of being able to visit the unit and who may one day visit the unit                                           |
| Educational                | 1. Value ascribed to field trips, courses, projects, or other educational experiences on the unit                                                                                                                                | 1. Value of increased local environmental knowledge, awareness and engagement with BLM which may improve overall efficiency of land use and resource decisions<br>2. Building empathy, knowledge and awareness of land to improve collective environmental consciousness of community                    | 1. Bequest value: value for future generations to be able to receive similar educational benefits                                                                                                                                                                                                        |
| Cultural/Historical        | 1. Values ascribed to cultural experiences, as described in terms of individuals' willingness to pay for these activities                                                                                                        | 1. Community value of sense of place associated with preservation of cultural heritage                                                                                                                                                                                                                   | 1. Bequest value: preserving cultural sites for future generations to connect with<br>2. Option value: value for individuals to have the option to visit a cultural site at some point in their lives<br>3. Existence value: value to individuals for whom the site is important but who may never visit |
| Paleontological/Geological | 1. Value of mineral extraction potential<br>2. Value associated with paleontological, archaeological, or geological discoveries                                                                                                  | 1. Values supported by geologic processes such as:<br>a. Geologic carbon sequestration and storage supporting climate regulation and air quality which generates health and productivity benefits<br>b. Replenishment of aquifers and water retention which supports healthy and lower cost water supply | 1. Option value: value for archaeologists or paleontologists to one day study the unit                                                                                                                                                                                                                   |
| Scientific                 | 1. Value associated with using resources on the unit as a living laboratory, as opposed to conducting research or educational experiments in an indoor lab<br>2. Community values associated with science visits and conferences | 1. Value of products or services that develop as a result of scientific discoveries on the unit                                                                                                                                                                                                          | 1. Option value: value of being able to conduct research on the unit in the future<br>2. Bequest value: value for future generations to learn science hands on at the unit                                                                                                                               |

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

|                            |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                             |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Water/Riparian             | 1. Value of healthy fisheries and healthy water flow for other water based recreation; visitor spending on these activities<br>2. Value of water or watershed as a freshwater source                                                                         | 1. Riparian zones provide:<br>a. Decreased prevalence of algal blooms<br>b. Increased nutrient retention and increased vegetative diversity and density<br>c. Crop protection from wind and other damage<br>d. Bird and other wildlife densities<br>e. Flooding and natural disaster protection<br>2. These values provide health benefits to community members, improved crop production and enhanced recreational values | 1. Bequest value: value of maintaining healthy water source and water ecosystem for the benefit of future generations                                                                                                                                                                                                       |
| Wildlife/Habitat           | 1. Value ascribed to hunting experiences, value ascribed to wildlife viewing and photography                                                                                                                                                                 | 1. Community values for conserving populations that impact sense of place or community cultural identity, i.e. conserving the habitat for "charismatic megafauna"<br>2. Crop pollination services provided by healthy populations of bats and bees<br>3. Avoided cost of population control and disease prevention required when natural biological processes do not take place                                            | 1. Bequest value: value for future generations to be able to see natural habitats and wildlife<br>2. Option value: value for an individual to be able to see natural habitats and wildlife at some point<br>3. Existence value: value placed on the continued existence of biodiversity not related to visiting the habitat |
| Vegetative                 | 1. Values associated with plant, food, or fibers that can be collected<br>2. Value of timber harvest potential<br>3. Forage values, as measured in AUMs                                                                                                      | 1. Carbon sequestration and storage, supporting climate regulation and air quality, which generates health and productivity benefits<br>2. Erosion prevention and soil health supported by healthy vegetation                                                                                                                                                                                                              | 1. Bequest value: value for future generations to receive the same benefits                                                                                                                                                                                                                                                 |
| Local Economic Opportunity | 1. Using the monument as an resource to provide recreation based tourism and support jobs<br>2. Value of having job opportunities related to recreation use of the monument and federal management                                                           | 1. Value of a diverse local economy which benefits from BLM jobs and those supported by visitors.                                                                                                                                                                                                                                                                                                                          | 1. Bequest value: value for future generations to have same diverse economic employment opportunities                                                                                                                                                                                                                       |
| Additional Values          | 1. Payments in Lieu of Taxes (PILTs) to compensate counties for losses in property taxes<br>2. Portion of home values associated with viewsheds of National Monument, and portion associated with accessibility to low cost outdoor recreation opportunities | 1. Amenity migration of people seeking quality of life related to scenic views and outdoor recreation opportunities                                                                                                                                                                                                                                                                                                        | 1. Bequest value: value to future generations of having a "National Conservation Lands" system                                                                                                                                                                                                                              |

**Table C3: Valuation Techniques to Assess the Economic Value of National Monuments and NCAs**  
After values have been identified and described based on Tables C1 and C2, the techniques from the table below can be applied to quantify and/or monetize the most relevant values.

Formatted: Centered

Formatted: Indent: First line: 0"

## An Analysis of the Economic Effects of the National Conservation Lands

February 2017

| ROV Category               | Market Based Valuation Techniques                                                                                                                         | Nonmarket Valuation Techniques                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recreational               | 1. Total revenue from recreation use fees                                                                                                                 | 1. Estimating consumer surplus from recreational experiences using the benefit transfer method or an original travel cost or contingent valuation model<br>2. Avoided costs of health and fitness expenditures that are saved to individuals by the provision of low or no cost outdoor recreation<br>3. Hedonic pricing of home values near the unit that are impacted by access to recreational opportunities                                                                                                          |
| Educational                |                                                                                                                                                           | 1. Estimating willingness to pay for environmental education through contingent valuation, or utilizing a benefit transfer of previous contingent valuation studies valuing environmental education or interpretation<br>2. Quantify the number of events, interpretive visits, field trips, or other partnerships and educational activities that take place on the unit                                                                                                                                                |
| Cultural/Historical        |                                                                                                                                                           | 1. Contingent valuation for protecting cultural sites, and willingness to pay for visits to cultural sites                                                                                                                                                                                                                                                                                                                                                                                                               |
| Paleontological/Geological | 1. Using market prices and estimated natural resource abundance to measure the saleable value of mineral resources                                        | 1. Measuring geologic carbon sequestration, applying social cost of carbon to estimate benefits of carbon storage<br>2. Drinking water costs in communities that depend on nearby aquifers or aboveground sources that are protected by protecting geologic formations                                                                                                                                                                                                                                                   |
| Scientific                 |                                                                                                                                                           | 1. Quantifying research proposals/journal articles taking place in units<br>2. Number of scientific partnerships with universities or institutions and any money paid by universities or institutions                                                                                                                                                                                                                                                                                                                    |
| Water/Riparian             |                                                                                                                                                           | 1. Decreased costs of providing clean drinking water<br>2. Avoided costs of potential flood damage, algal bloom damage<br>3. Impact of healthy riparian zones on crop values                                                                                                                                                                                                                                                                                                                                             |
| Wildlife/Habitat           | 1. Prices paid to acquire hunting and fishing licenses and tags for game within units.                                                                    | 1. Valuing the impact of pollinators on nearby crop productivity<br>2. Estimating avoided costs of pest control provided by biodiversity<br>3. Valuing willingness to pay for biodiversity through benefit transfer method or original contingent valuation study<br>4. Valuing willingness to pay for hunting or wildlife based recreational activities<br>5. Quantifying businesses that are tied to wildlife viewing or number of sites where sense of place or other community values depend on a species or habitat |
| Vegetative                 | 1. Market value of any harvested plant materials<br>2. Market value of current levels of livestock grazing                                                | 1. Benefits of erosion prevention provided by healthy root systems, as measured in improved water quality<br>2. Measuring biomass carbon sequestration, applying social cost of carbon to estimate benefits of carbon storage                                                                                                                                                                                                                                                                                            |
| Additional Value           | 1. Though not a value, measuring economic activity generated through visitor spending can help describe the value to the functioning of the local economy |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Local Economic Opportunity |                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Additional Values          | 1. Calculating PILT amounts based on federal reporting                                                                                                    | 1. Identifying population shifts, demographic shifts or opening and closing of businesses that can signal presence of amenity migrants                                                                                                                                                                                                                                                                                                                                                                                   |

An Analysis of the Economic Effects of the National Conservation Lands

February 2017

**Commented [CEC4]:** These tables may be useful for grand canyon parashant at some point? But they don't need to be in this appendix. Maybe could be added to the standalone report for GCPNM.
